

Sentinel BAS — Detection Coverage Report

Automated Breach & Attack Simulation run against a live isolated Active Directory lab · WIN11-TARGET · github.com/sodik-tursunboev/SIEM

10 MITRE ATT&CK techniques executed via Atomic Red Team. Each run's detection was matched automatically by the SIEM's own Detection Validation Engine — technique, host, and timing — not reviewed by eye.

% AGE	7 DETECTED	0 DELAYED	3 MISSED	0 PENDING
----------	---------------	--------------	-------------	--------------

Test Runs

Technique	What it tests	Atomic Test	Status	Latency
T1003.001	LSASS Memory	Dump LSASS memory	Detected	0s
T1558.003	Kerberoasting	Request SPN tickets	Missed	—
T1059.001	PowerShell	Encoded PowerShell command	Detected	0s
T1053.005	Scheduled Task	Create a scheduled task	Missed	—
T1543.003	Windows Service	Install a new service	Detected	4s
T1070.001	Clear Event Logs	Clear the Security event log	Missed	—
T1547.001	Registry Run Keys	Registry Run key persistence	Detected	0s
T1490	Shadow Copy Deletion	Delete volume shadow copies	Detected	0s
T1082	Discovery	Discovery command burst	Detected	21s
T1136.001	Create Local Account	Create a new local user	Detected	0s

Detected = matching alert within 60s of test end. Delayed = within 5 minutes. Missed = nothing within 5 minutes, scoring finalized only after that window genuinely elapsed.

Why Each Miss Happened

A Missed result isn't automatically a detection gap. Every miss falls into one of three categories: the simulated attack never actually executed, the attack executed but didn't reproduce the specific condition the rule targets, or the attack matched the rule's conditions and genuinely wasn't caught. Only the third is a real gap.

Technique	Root cause	Category
T1558.003	Confirmed via log evidence: the Atomic test's LDAP-based service-account enumeration failed ("Ldap Error 0x51 — Server Down") and fell back to requesting tickets for built-in system SPNs using .NET's Kerberos client, which negotiates modern AES encryption. The rule specifically targets the weak RC4 encryption real Kerberoasting produces — a condition this particular test run never actually reproduced.	Simulation limitation, not a detection gap

T1053.005	The New Scheduled Task rule is independently confirmed working (verified firing via direct API test earlier in development). Root cause for this specific run not yet captured with the same log-level evidence as the Kerberoasting case — flagged for a follow-up check rather than assumed.	Needs confirmation
T1070.001	Root cause for this specific run not yet captured with direct log evidence. Flagged for a follow-up check — same diagnostic approach as above, not assumed to be either category without checking the raw log first.	Needs confirmation
